

How to notify user that he logged more time than was originally estimated

Problem: Your users are logging their work hours in Jira tickets. Every time this happens, you would like to check against Original estimate and notify your users (and perhaps somebody else) that the original estimate was exceeded.

Solution: Create a new Notification of type "Issue worklog added" and specify JQL rule like this: **workratio > 100**

This effectively means that only those issues will qualify where condition **(time logged / time spent) * 100 > 100** is true

Follows the example screenshot of such configuration:

The screenshot shows the Jira Notification configuration interface. The 'Title' field is 'Notification for exceeding original estimate'. The 'Enabled' checkbox is checked. The 'Audit enabled' checkbox is unchecked. The 'Notification type' is 'JIRA issue event'. The 'Project' is 'MFP - MFP'. The 'Issue type' is 'Any'. The 'Event' is 'Issue worklog added'. The 'JQL filter' is 'workratio > 100'. The 'Run as' user is 'admin'. The 'Send via' method is 'EMAIL'. The 'TO' field is 'Assignee'. The 'CC' field is 'Project lead'. The 'BCC' field is 'Choose JIRA fields'. The 'Subject' field is 'Logged time exceeds original estimate for \$issue.key'.

As for message template, it could look like this:

```
<pre>
Hello

You've logged more time than was originally estimated for this task <a href="http://localhost:2990/browse/$issue.key">$issue.key</a>

Logged time total: $!issue.fields.timespent
Original estimate: $!issue.fields.timeoriginalestimate

Raley
</pre>
```
