Version 3.0.3-J7

- **Fixed** - Maintenance release to address issues with email subject & accessing components

Version 3.0.2-J7

- **Fixed** preview for digested notifications

Version 3.0.1-J7

- **Fixed** backward compatibility with JIRA 7.0.x

Version 3.0.0-J7

- 1) Introduced Canned messaging from issue detail page
- 2) Improved granularity of events for Issue-based notifications: issue assigned, issue moved, issue worklog added/updated/deleted, issue status transition, issue comment added/updated/deleted
- 3) Issue events, Canned messaging, version events and scheduled messaging are now scoped exclusively to JIRA project
- 4) Jirassimo is available from the top JIRA menu to both: JIRA administrators and project administrators. Project administrators can configure notifications only for those project(s) where they have administrator privilege. JIRA administrator can configure notifications for any project. Project-type notifications are configured exclusively by JIRA administrator
- 5) For email destinations you can now choose standard and custom issue fields where email addresses are stored.
- 6) Option to omit sending notification to the author of change (user who triggered specific issue event)
- 7) Pre-generated subject and message body to get you on the track ASAP
- 8) Simplified templating - from this version only Velocity-style templates are supported. You can use "field picker" to easily get the code for rendering specific field both, standard and custom.
- 9) A number of "convenience" fields are introduced (comment added, issue last change etc). Those are helpful to get your first notification up and running in next to no time.
- 10) Greatly improved support for testing of digested notifications. When you provide the CRON expression, the system will calculate previous run time and in preview you'll see all the messages that would be send as if this notification was run now.
- 11) Audit tab in JIRA issue detail view now stores all the messages sent for specific issue by Jirassimo
